

Product Information

Calbe R 09 Developer Concentrate

Calbe R 09 is a p-Aminophenol based developer for black and white negative films packaged as a liquid concentrate in 250ml plastic containers. Calbe R 09 is very flexible and delivers negatives of high quality whilst maintaining maximum film speed even when highly diluted.

Preparation

Calbe R 09 is made ready for use by diluting with water. The normal dilution factor is 1+40

Developing times

Consult the film manufacturers recommendations.

If dilutions other than 1+40 are used, alter the recommended development times by the following factors

Dilution	1 + 20	1 + 60	1 + 80	1 + 100	1 + 150	1 + 200
Factor	x0.5	x1.5	x2.0	x3.0	x4.0	x6.0

Agitation

The developing tank should be agitated or invert continuously for the first minute and then for 3 seconds (1 inversion approx) every 30 seconds.

Capacity

Calbe R09 is designed to be used as a one-shot developer. However, in 600ml developer (1 + 40) 4x 35mm 36exp or 120 roll film may be processed. Extend the developing time of the 3rd film by 1 minute and the 4th film by 2 minutes to compensate for the chemicals becoming exhausted.

Safety with Chemicals

Keep out of reach of children!

Wear rubber or latex gloves. Chemicals may cause the skin to become sensitized after contact and may cause allergic reactions. In case of contact with the skin or in the eyes wash with plenty of clean running water and consult a doctor or eye specialist.

Do not use chemicals near food preparation or consumption areas. Do not drink or eat near photographic chemicals of any kind.
